

Using the Eyedirect as a Teleprompter - Hardwired

This is a simple solution to turn an EyeDirect into a Teleprompter. The process is the same as with a dedicated teleprompter except we are using a modified Eyedirect .

The laptop running Teleprompting software is screen mirrored to the EyeDirect monitor via HDMI out. By converting HDMI to SDI it simplifies maintaining longer distances between laptop and Eyedirect.

Equipment Needed:

- 1 x Macbook Laptop (w/ Teleprompter Software)
- 1 x EyeDirect
- 1 x 9" SDI Monitor (must fit inside EyeDirect)
- 1 x Blackmagic HDMI to SDI Converter

Notes:

* This is no replacement for the skills of a professional teleprompting service. This is a simple solution for times when this service may not be practical or readily available.

* For our testing we used nPrompt Express software.

* The EyeDirect requires a custom 9 -10" SDI monitor for optimal sizing.

* The EyeDirect monitor may need to be image flipped. Make sure your monitor can do that!
